Abstract: The coastal waters of the Atlantic Islands of Galicia National Park encompass one of the most important recruitment areas for the species *Octopus vulgaris* in Galician waters (Guerra et al. 2014). On 1 June 2019, at the Cíes Islands (42° 13' 23.52" N, 8° 53' 56.61" W), located within the park, the bipedal locomotion of a juvenile specimen of *Octopus vulgaris* was documented (Fig. 1; Video S1).
